U.S. Department of Energy's Office of Nuclear Energy

Idaho National Laboratory

This Talk: Performance, Data, and Decisions

- **Focus of this talk:** Creating a direct link between data and decisions through data analytics methods
- **Application:** Nuclear power plants
- **Claim:** Pure data-centric methods do not support robust and resilient decisions
- **Challenge:** Provide context to available data
 - Machine reasoning requires such context
 - MBSE models can be a solution

An Intuitive Example

Asset

Data

Abnormal event

Check

Fix

Restore

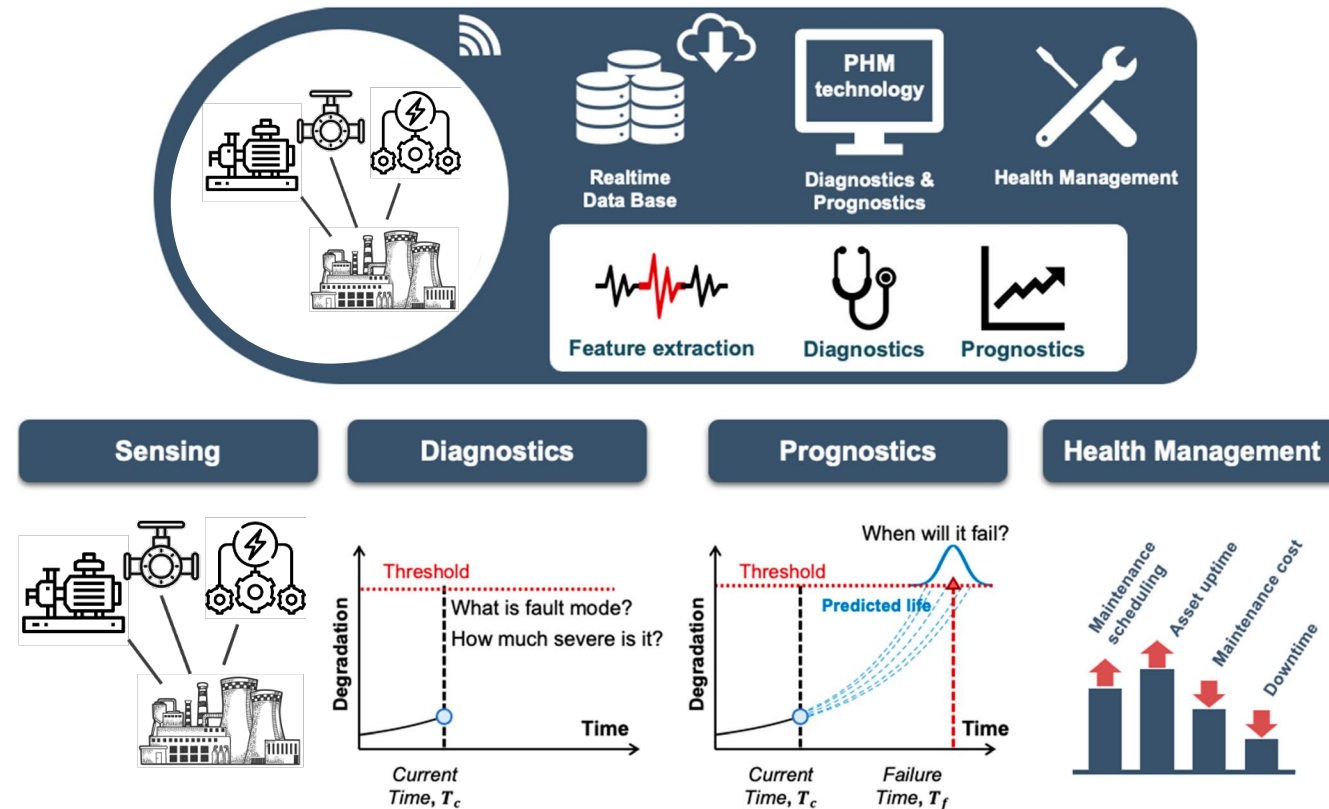

Record

Data and Decisions

- **Data:** Nuclear power plants collect large amounts of data elements
 - Record health performance throughout the lifecycle of assets
 - Can provide system engineers with insights into
 - Anomalous behaviors or degradation trends
 - Possible causes and their direct consequences
 - Data formats
 - Numeric: online monitoring data (e.g., pump vibration data)
 - Textual: issue reports and maintenance reports
 - Need to integrate information contained in numeric and textual data elements
- **Decisions**
 - Adapt to evolving operational conditions
 - Discover and counteract abnormal behaviors
 - Automate decision process

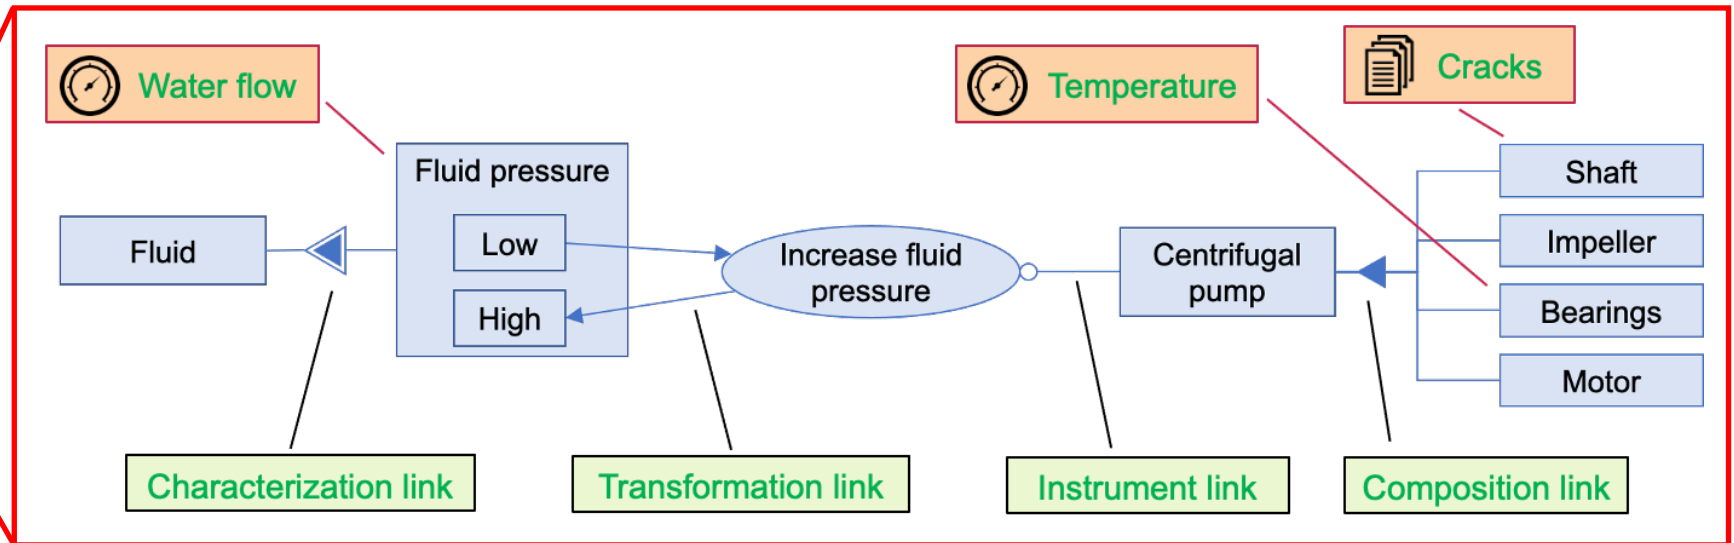

Adapted from: Kim S, Choi J-H, Kim NH. Challenges and Opportunities of System-Level Prognostics. *Sensors*. 2021; 21(22):7655. <https://doi.org/10.3390/s21227655>

Putting Data into Context

- Need to **emulate** system engineer knowledge about assets and systems
- **Solution:** Model-Based System Engineering (MBSE) diagram-based representation
 - Identify causal links between “Form” and “Function” elements
 - MBSE languages: Object Process Methodology (OPM), Lifecycle Modeling Language (LML)
- Link between MBSE models and data can be established
- **Machining reasoning:** Identify logical links between data elements through MBSE models

Data is not enough!

Analysis of Numeric Data

- Model centric approach to data analytics: Based on **causal inference**
- **Goal:** Extract causal information among observed variables
 - Discover and quantify causal relations among observed data
 - Data translated in graphs: Structural causal models

Def. Cause-Effect Relation ($A \rightarrow B$).

A physical phenomena such that a change in A leads to a change in B

Statistical conditional independence testing

Statistical regression modeling

- Focus on the relations between variables rather than the variables themselves
- MBSE models are used to inform the process of causal discovery
- **Applications**
 - Formulate control profiles
 - Anomaly detection
 - Test hypotheses (e.g., missing edge has emerged)

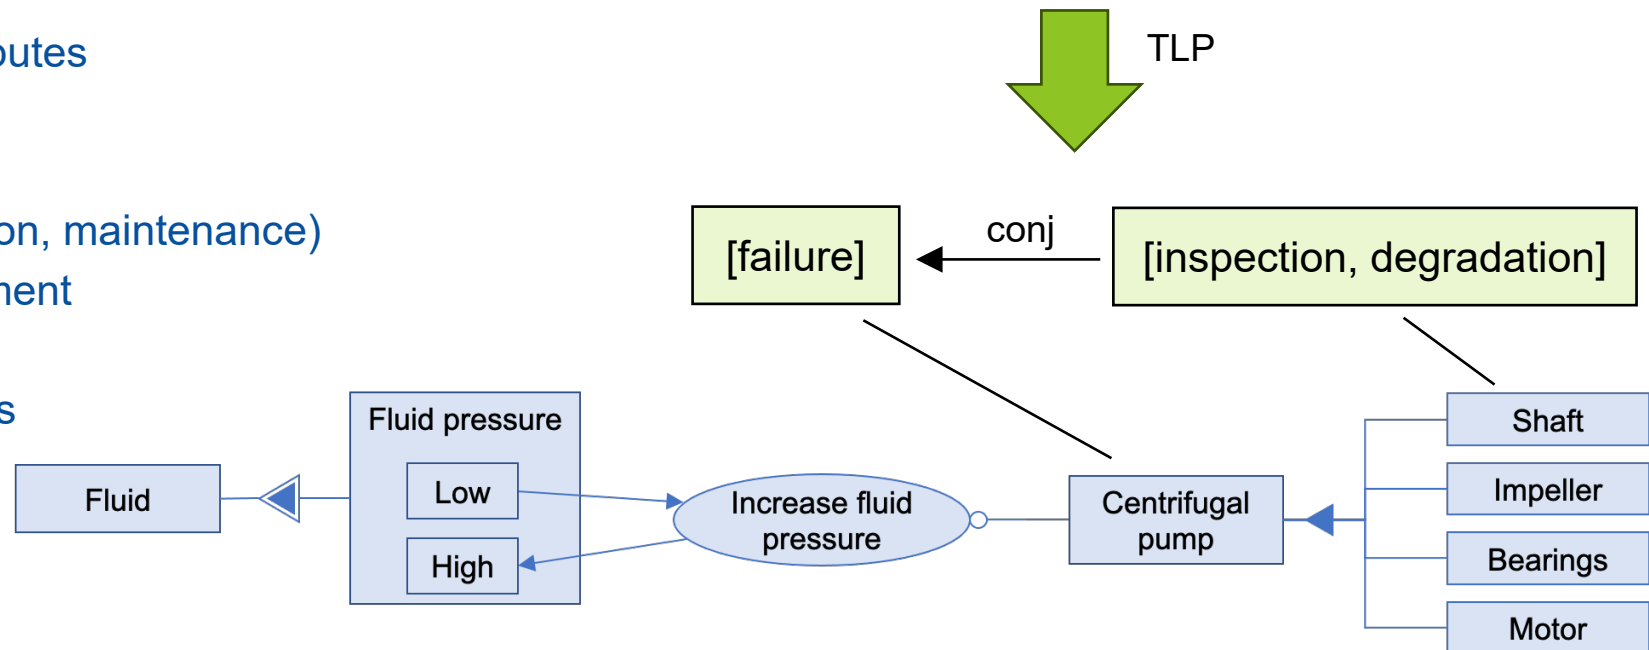

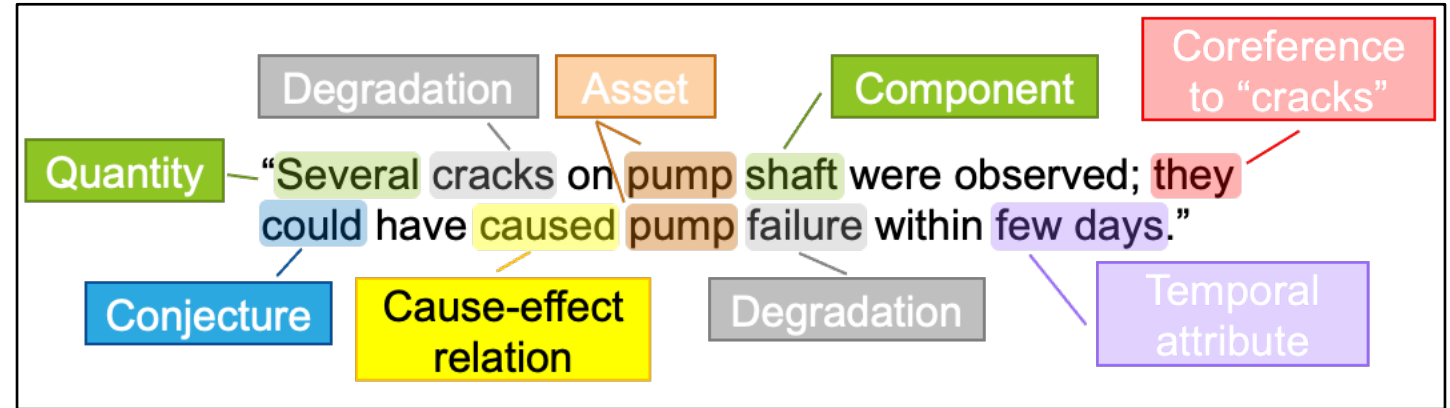

Causal inference

Analysis of Textual Data

IR-22-24585

- Technical Language Processing (TLP) methods
 - From text to knowledge
- Developed functionalities
 - Spell check and abbreviation handling
 - Identification
 - Nuclear related keywords
 - Temporal and location attributes
 - Measured quantities
 - Assessment reported event
 - Event nature (e.g., inspection, maintenance)
 - Component health assessment
 - Cause-effect relations
 - Link data to MBSE model entities

Capturing System Knowledge

- Knowledge is stored in the form of a graph (relational database): MBSE graphs are the underlying skeleton
- Data elements are associated and linked to specific MBSE entities
 - Data is put into an **MBSE context**
- **Knowledge graph** captures system architecture and data
- **Machine reasoning**: Identification of causal relationships between data elements
 - Requires two conditions: logical and temporal

SCR #: D-204

1-20-PM1 was discovered to have water/oil mixture in sight glass. Pump was shutdown.

MBSE-based graph
(system architecture)

Anomaly association to knowledge graph

Textual data association to knowledge graph

Final Considerations

- **Advanced data analytics methods**
 - Extracting knowledge from textual data
 - Quantifying asset behaviors through causal inference
 - Summarize system performance in an MBSE-based knowledge graph
- State of the art data analytics methods can be used to support plant operations
 - **Industry 4.0 mindset**
- **New roles of system engineers**
 - *Data*: Assess how data reflects known phenomena
 - *Methods*: Assess performance of data analytics methods
 - *Decisions*: Assess how decision making reflects the outcomes generated by data analytics methods
