## Problem

Large Language Models (LLMs) struggle out of the box when answering factually about detailed questions, especially in domains that are sparsely represented in their training data. This causes hallucinations and reduces reliability making it difficult for them to be used in practice.

## Methods

Nuclear diagnostics

Other private documents

Images, Figures

Work orders

We implement a multistage pipeline to let LLMs access external information via Retrieval Augment Generation and to evaluate the results for factual accuracy.

#### **User Query** Relevant Passages Deep Passage Retrieval "What should I do if Relevant Passages can be a valve is missing individual paragraphs, during inspection?" work order, sentences. Passage size is a **Outside** hyperparameter set when loading the outside **Documents** documents A deep learning model called a

most similar to the user query.

# Retrieval Augment Generation

What does CWS mean? Central Weather Large Language Models struggle in disciplines like nuclear diagnostics due to a lack of online information... Circulating Water System! ... But can be prompted with relevant information to improve utility! Nuclear **Diagnostics** Handbook

Retrieval Augment Generation (RAG) [1] uses a deep learning model called a Deep Passage Retriever, that embeds queries and passages from external documents, and returns the document with the highest similarity to the user query. The LLM is prompted with the most relevant passages to the users' questions and asked to generate a response.

## Significance

www.inl.gov

This work shows that using RAG techniques can improve accuracy and reliability, allowing for the application of LLMs in specialized areas, even when those areas that aren't extensively covered in their initial training.

## Contributions

1. We implemented Retrieval Augmented Generation for Chatbot LLM's allowing for reliable and accurate nuclear diagnostic question answering.

Not available for content • Not available for content • Not available for content • Not available for content

- 2. We Implemented fact evaluation tool to concretely evaluation LLM generations and identify hallucinations.
- 3. This model will be deployed in VIPER: Visualization for Predictive maintenance Recommendation's.

### **Chatbot LLM Fact Evaluator Graded and Cited** Response The Fact Evaluator grades the chatbot Finally, the graded response response for factual Models like LLama2, is paired with the extracted

accuracy.

**Factuality Evaluation** 

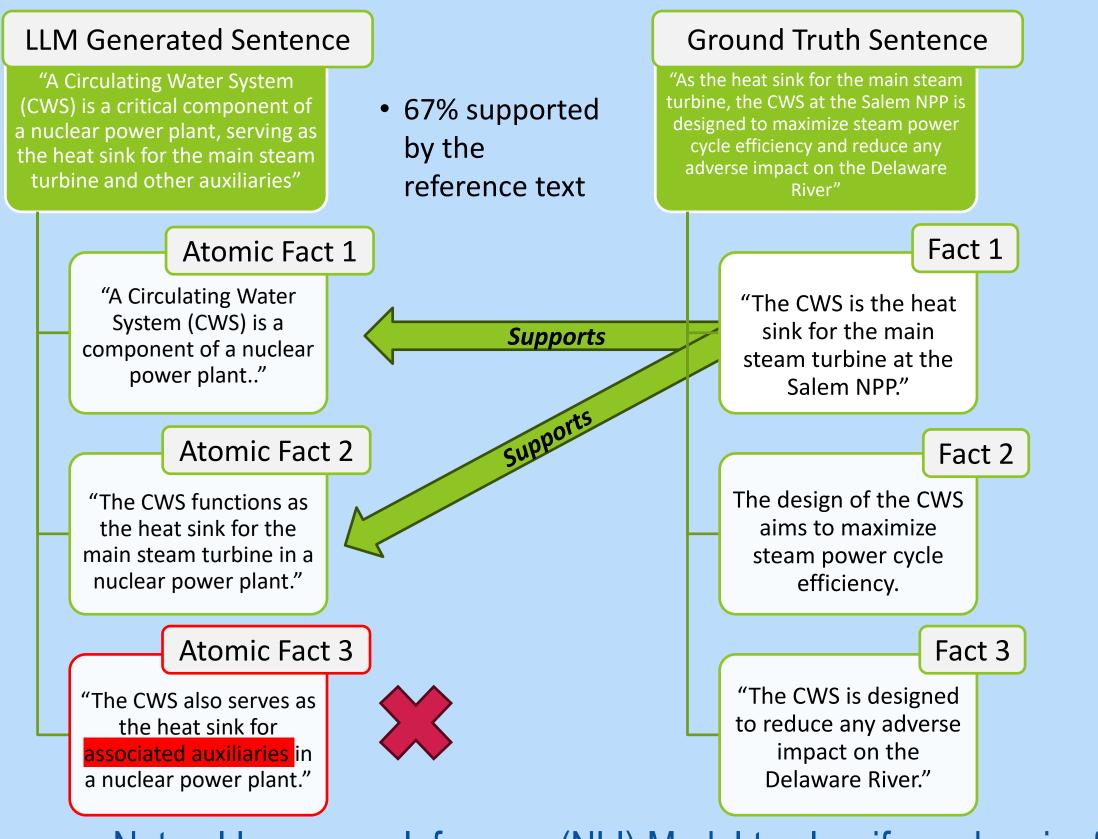

ChatGPT answer the

use query.

To evaluate LLM generations for factual accuracy, we ask the LLM to break down each sentence from both the generation and the retrieved passage into a list of atomic facts [2] [3]. An "Atomic Fact" is the smallest claim that can be extracted from a sentence.

passage and given to the

user.

Then we use a Natural Language Inference (NLI) Model to classify each pair of generation facts and passage facts as either Entailment (Supported), Neutral, or Contradictory. To be considered true, a generated atomic fact must be supported with at least 50% probability by a fact from the ground truth.

## Results

To evaluate our RAG pipeline, we compared LLM performance on 5 questions related to predictive maintenance with and without our rag pipeline. We see a 131% increase in performance according to the Fact Evaluator. We also measure the degree to which the Fact Evaluator adheres to human opinions. We had a human hand verify each atomic fact across the 5 generations and saw that our Fact Evaluator has a 0.90 F1 score, or in other words 87% of the time it agrees with the human evaluation.
