## *What is a Supercomputer?*

A computer that operates at or near the peak performance achievable within the constraints of existing technology and available power and cooling.

## What makes a supercomputer "super"?

- Cost:
  - A leadership scale supercomputer costs ~\$1E8!
- Size:
  - Can require 6,000+ square feet of space!
- Power:
  - Can require \$6-7 million/year to operate
- Speed:
  - INL's supercomputers can compute in one second what would take a human with a calculator 50 trillion years!
- Rate of innovation:
  - Today's smart phones are faster than supercomputers in the 1970's!

VS

# Epochs in Supercomputing

- Automated Calculators: 2400 BCE to 1900's

2400 BCE – The Babylonian Abacus

Charles Babbage "Analytical Engine" (1834)

The Harvard Mark 1 (1944)  
Peak performance: 1 instruction/sec

## *Von Neumann architecture in Vacuum Tubes*

The vacuum tube invented by Thomas Edison by accident in 1880 gave rise a new epoch in computing capability:

The Electronic Delayed Storage  
Automatic Calculator (1949).  
Peak performance: 600 instructions/sec

The ENIAC (1945).

The IBM 701  
(1952). Peak  
performance: 4000  
instructions/sec

## The Transistor

- The transistor was invented at Bell labs in 1947 as an alternative to the vacuum tube; it uses semiconducting materials to act as an electronic switch

The CDC 6600: The "First" Supercomputer (1964)  
Peak performance: 1 Megaflops

Seymour Cray: "father of supercomputing"

## Vector Processing

- The Integrated Circuit (Jack Kilby 1959, Nobel prize 2000) and shrinking transistor sizes enabled small scale integration.

The Cray X-1, peak performance 136 Megaflops

## Attack of the Killer Micro

- Billions of transistors on a single semiconductor die. Concentrated functional capability on the microprocessor. Message-passing capability between devices

Touchstone Delta (1990s). 500 cores connected by mesh topology. 10-20 Gigafllops.

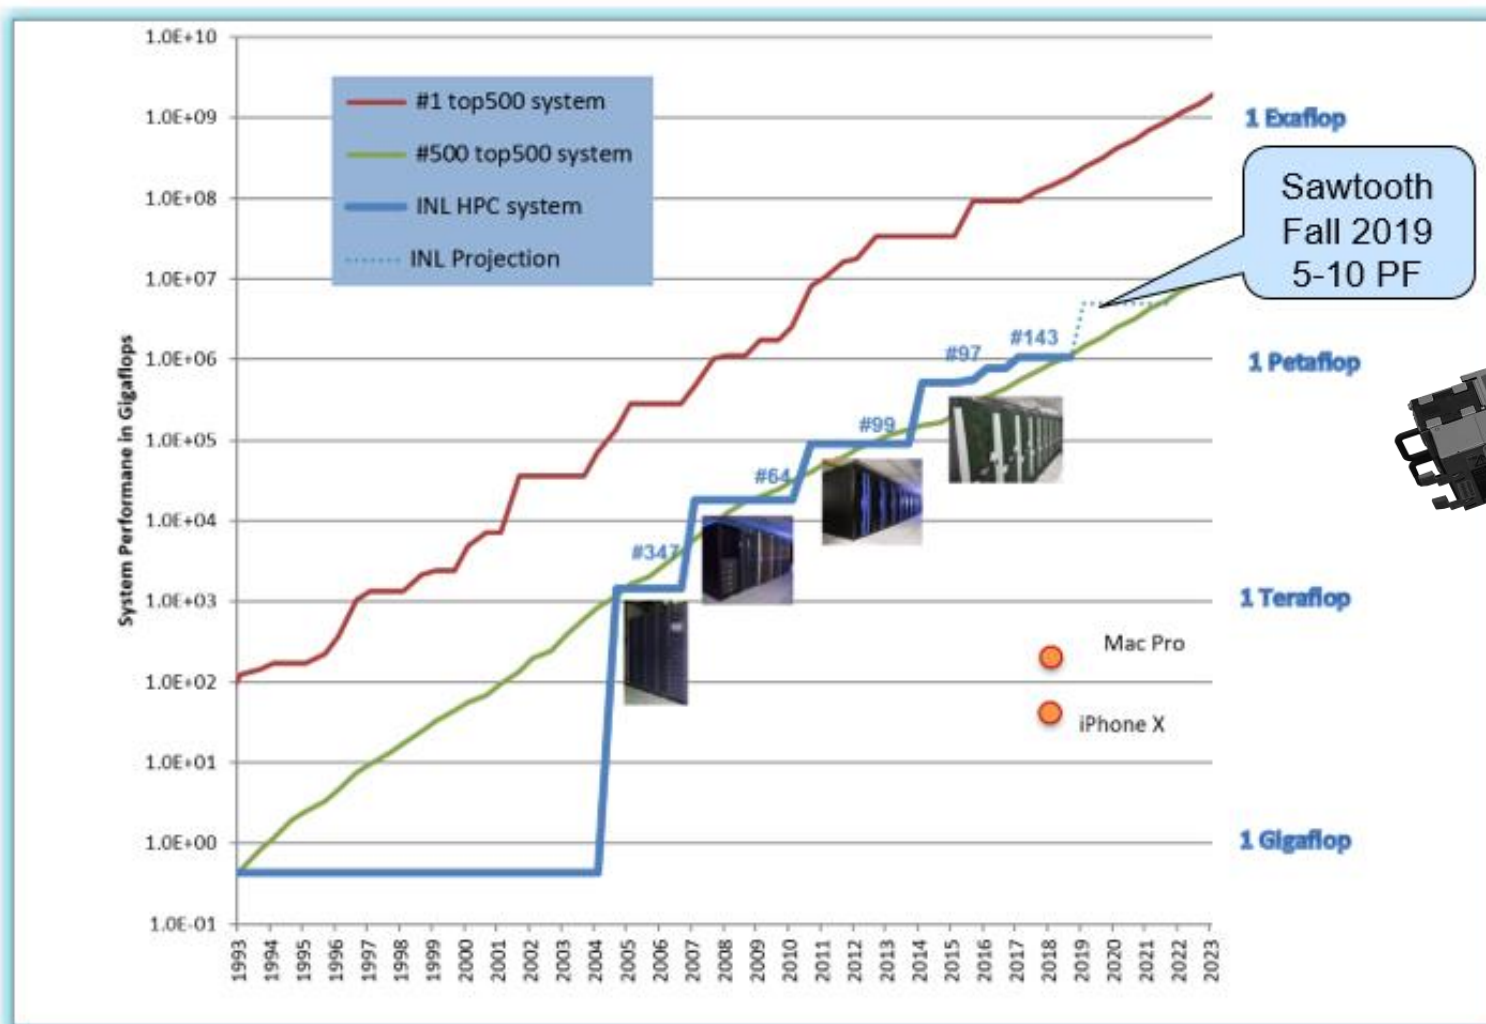

Beowulf cluster (1994). Today >80% of supercomputers are of this class.

We often use the term "cluster" to refer to Beowulf class supercomputers. The term originates from the DEC M31 Andromeda project.

# Multicore Petaflops

Node of Summit with 6 GPUs/node. Power for Summit: 13 MW

# Applications for Supercomputers

Supersteel design

Molecular dynamics materials simulations

Protein modeling for in-vivo simulation

Full core nuclear reactor simulation

Adaptive Mesh Refinement simulations
