Calculating Radiation Damage (DPA) from Transmutation Products

PRESENTER:

Sebastian Schunert

BACKGROUND:

- Radiation damage changes materials
- Methods ignore changing compositions
- 20% of damage can be missed in some materials

METHODS

1. Use existing transmutation solvers
2. Tested with Greenwood Ni-59 work

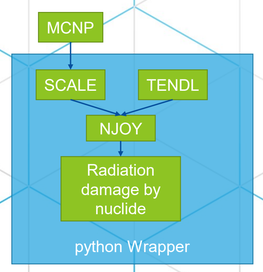
$$\frac{\partial \widehat{E}}{\partial t} = \sum_{p=1}^{P}\left(\lambda_p \eta_p N_p(t) + N_p(t)\int_0^\infty \sigma_{D,p}(E)\phi(E,t)dE\right)$$

Introduced New Terms to Bateman System

$$\widetilde{N} \equiv \left(N_1, \ldots, N_I, \widehat{E}\right)^T$$

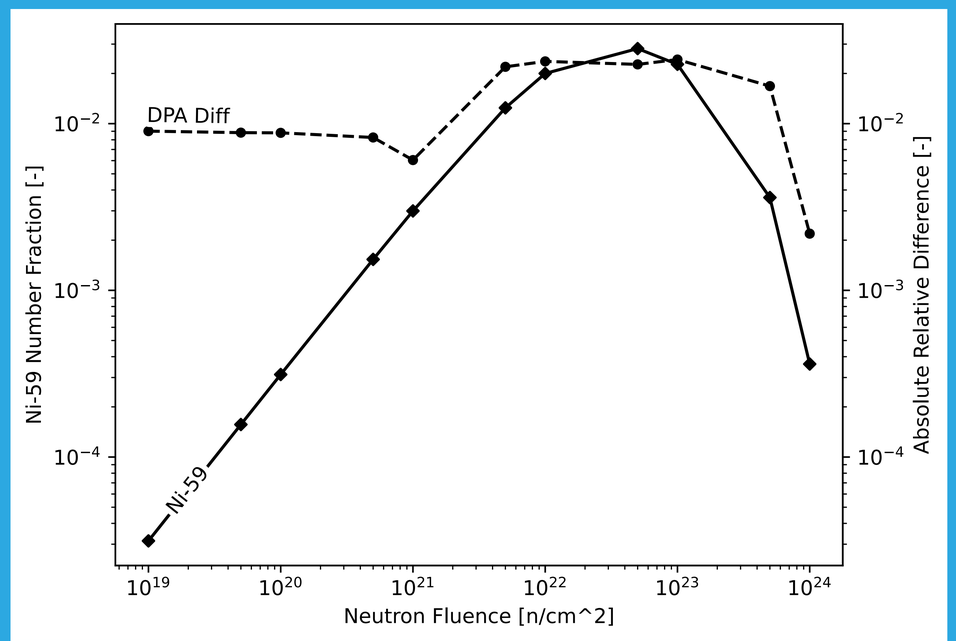
$$\frac{\partial \widetilde{N}}{\partial t} = \widetilde{A}\widetilde{N}$$

3. Systematically found sources of DPA
   1. See examples in plot



4. Created *ab initio* models for damage from radioactive decay

Demonstrated that Existing Tools Can Easily & Accurately Calculate Radiation Damage. Demonstration performed in Griffin Transmutation Solver



Difference in DPA in demonstration were due to rounding in benchmark article
