**Prepared for the
U.S. Department of Energy
Under DOE Idaho Operations Office
Contract DE-AC07-05ID14517**

PRESENTER

Thomas Mason

Defense Systems
National & Homeland Security

Seeking materials with high strength and high fracture toughness.

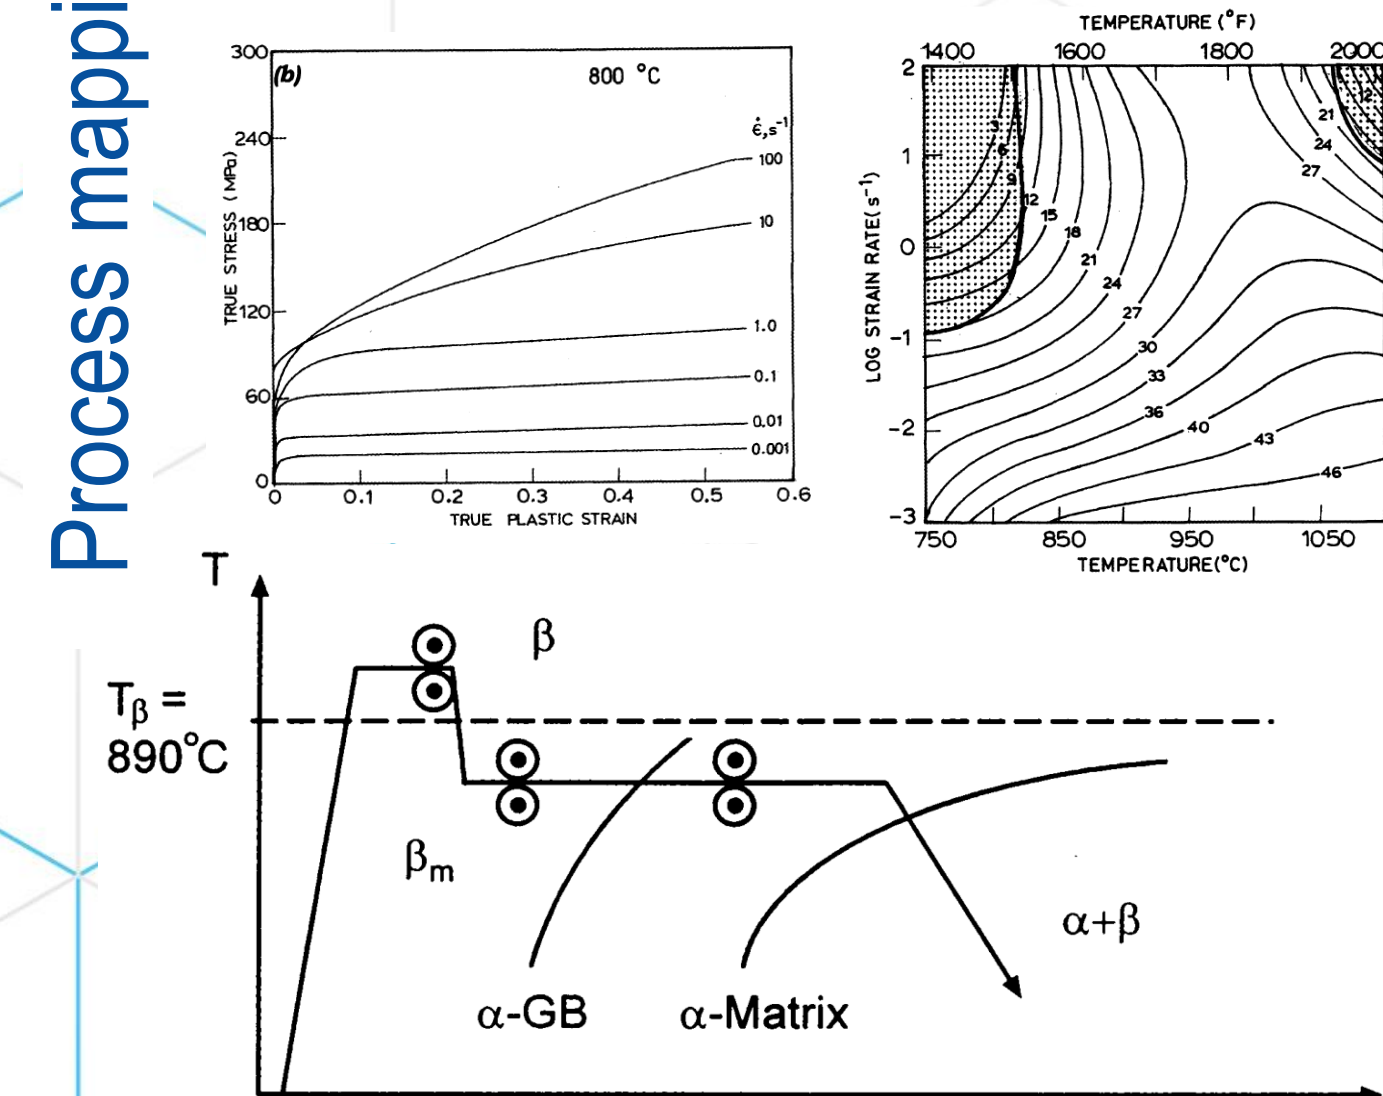

These two properties are often at odds.

Are the microstructural features contributing to good performance making characterization harder?

Multi-phase titanium alloys have potential to exhibit both high strength and high fracture toughness if the microstructure can be tailored appropriately through thermomechanical processing.

Process mapping

Solution-ize, Deformation and Age
Serendipity

Knowledge of constituents versus arrangements

Examples of possible microstructures

Identification of processing steps for beneficial microstructure arrangement would expand the application space and provide targets for AM processing routes

Processed with Spherical Indexing
